

## Wireless Telemetry Controller

---

Model No. *W1710 POCSAG Airport*

136-960MHz Frequency Synthesized

## Operation Manual

Wireless Devices Inc. (Taiwan)

[v1.721]

The **W1710 POCSAG Airport** series is the high performance VHF/UHF, 868MHz and 915MHz paging telemetry controller, which is specially designed for the electric power lines ON-OFF remote control and the data message receiver for security alarm applications etc. And the control concepts are to utilize thru either the existed POCSAG paging infrastructure or on-premises paging transmitter to send out the various many message demands.

**1. Appearance of the W1710 POCSAG Airport Case and Jacks.**

A. <Relay output >		
Terminal	Name	Description
T1	Relay 1 N/O	Dry contact of relay #1 normal open
T2	Relay 1 Com	Dry contact of relay #1 common Max. 3A
T3	Relay 1 N/C	Dry contact of relay #1 normal close
T4	Relay 2 N/O	Dry contact of relay #2 normal open
T5	Relay 2 Com	Dry contact of relay #2 common Max. 3A
T6	Relay 2 N/C	Dry contact of relay #2 normal close
J3	Serial O/P	RS-232 Serial Input/output
J4	RS-485	RS-422/RS-485 Output
J2	USB	Micro USB for system programming
J1	DC Power	 DC Power 6V~35V input

## 1. Internal view of the W1710 POC SAG Airport PCB.

## 2. Computer Requirements for System Programming:

a). Programming by Windows PC Win7, Win10...etc

## 3. Operation Procedure:

a). Connect the USB cable plug into the computer USB port

And the other side of the micro USB jack to the W1710 device.

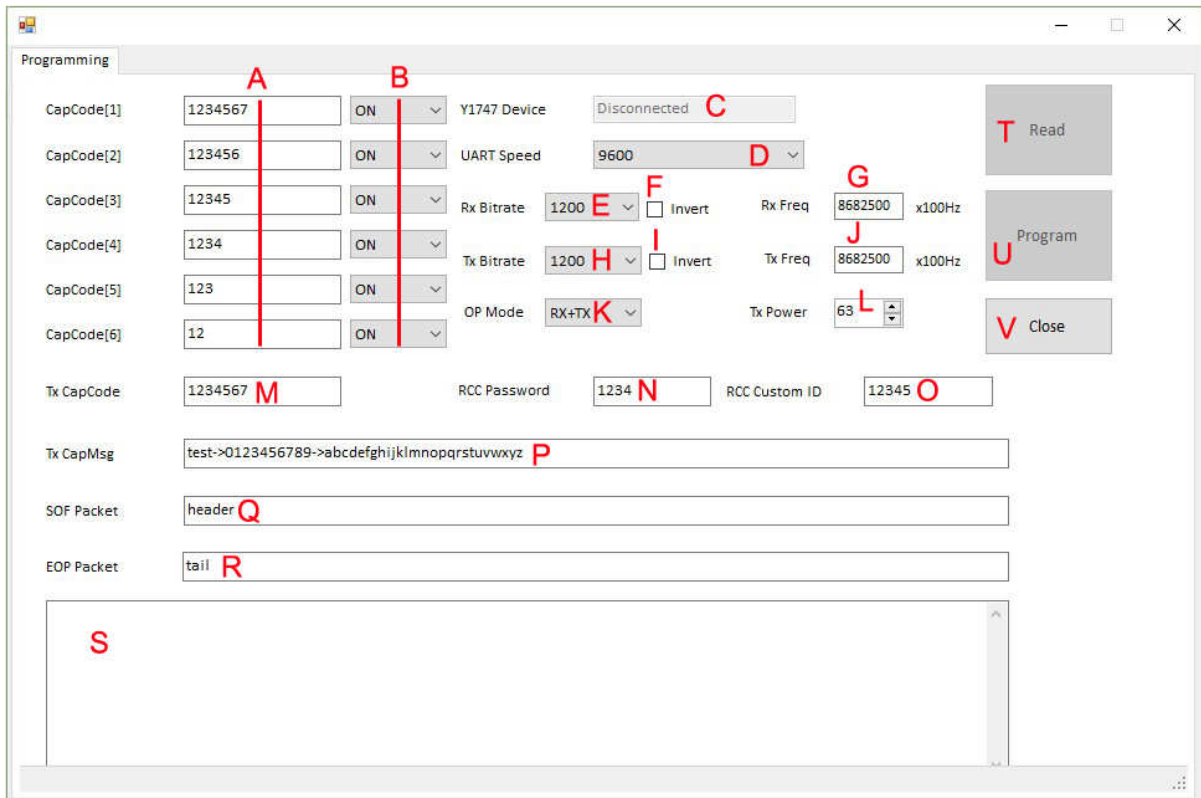

b). Insert the Program SD Card and click "W1747C112 OS" execution file to start the

programming process.

Also, the operation software can be installed into the HDD drive to run the writing process directly.

#### 4. Main Programming Screen Functions:

- **A.** for 1-6 Capcode,7digits POCSAG address range from 0000008 to 2097151
- **B.** for 1-6 Capcode, ON or OFF. (Enable or disable).
- **C.** for Device connected check, if display [Disconnected],checking USB jack.
- **D.** for PC Com Port Communication data rate set-up.
- **E.** for Receiver POCSAG data rate speed (512, 1200 or 2400 bps).
- **F.** for RX Data Polarity, Signal polarity selection (normal or Invert polarity).
- **G.** for Receiver Frequency set-up. (Full 7 digits are required. For example:  
4339200 = 433,920,000 Hz = 433.920MHz.)
- **H.** for Transmitter POCSAG data rate speed (512, 1200 or 2400 bps).
- **I.** for TX Data Polarity, Signal polarity selection (normal or Invert polarity).
- **J.** for Transmitter Frequency set-up. (Full 7 digits are required. For example:  
4339200 = 433,920,000 Hz = 433.920MHz.)

- **K.** for system operation mode set-up.  
**RX=** Receiver only with message by RS-232 TTL level output via J2 Pin 3  
Also active command P1, P2 via J2 Pin1 and Pin2.(command list see page 7)  
**RX+TX=** for 2 ways data output + message output + manual TX & automatic TX Message (each 10 minute)  
**FSK RX=** receiver FSK (NRZ) data output only. (without decoder)  
**FSK RX+TX=** FSK (NRZ) data output + message output + manual TX & automatic TX message (each 10 minutes)
- **L.** for Transmitter RF power output, range from 0 to 63 [63=FF=15mW].
- **M.** for Transmitter Capcode,7digits POCSAG address.
- **N.** for Remote Control front code (4 digital required)
- **O.** for Remote Control tail code (5 digital required)
- **P.** for Pre-programming Transmitter message.
- **Q.** When received the message, add this word in header before sending the message
- **R.** When received the message, add this word in tail before sending the message
- **S.** System information will be displayed here
- **T.** Read. Reading program data from the module.
- **U.** Program. Programming process to the module.
- **V.** Click. Close to exit this programming process screen.

## 5. Command lists for W1710 POCESAG telemetry controller series:

<<Remote Controller Application Section >>

How to activate command to Your Paging remote controller module

TTTTTTTTT PPPP ACC RRRRR

### Cautions: Tips for preventing the incorrect key set-up

[PPPP + ACC + RRRRR = 12 Digital codes (must = 12 digits exactly)].

TTTTTTTTT = POCESAG Cap code

**PPPP** = Password (0001~9999)

**A** = Output Port No

A=1 = Driver 1 output.

A=2 = Driver 2 output.

A=0 → Driver output Port #1+#2+. (all driver output ports).

**CC** = Output state,

Remark: (H=Hi, L=Low, T=Times, Z= Endless,)

00 = Always L

01 = Always H

12 = H2S/1T

13 = H1S/L1S/3T

14 = H2S/L2S/4T

15 = H10S/L10S/Z

16 = H20S/L20S/Z

17 = H1S/ L1S/Z

18 = H0.5S/L0.5S/Z

19 = H6S/L1S/Z

21 = H0.25S/L10S/H0.5S/L10S/H1S/L10S/H2S/L10S/H.Z

22 = H0.5S/1T

23 = H3S/1T.

24 = H20S/1T.

25 = H3S/L3S/10T.

26 = H2S/L2S/20T

27 = H1S/L1S/30T.

28 = H0.5S/L0.5H/30T

29 = H30S/1T.

ACC = 000 = All driver ports to low (always L)(same as all reset)

**RRRRR** = Customer ID, these 5 digits are for double check of the commands. And this customer ID code must be programmed Via P/C only (end user can not change).

Example:

# Specifications

<b>General</b>	
Size:	71mm X 61 mm X 10 mm (Module only without Housing) 76mm X 72mm X 33mm (with Housing)
Power supply requirements:	DC 6-35V 1A (Max)
Power consumption:	Standby 20mA, Relays active maximum 80mA.
Weight	40gm(Module only) / 90gm (with housing)
Operation Temperature	-40°C~85°C
<b>RF Performance</b>	
Frequency bands:	136 MHz ~ 960 MHz. Program By Frequency Synthesized.
Frequency stability:	+/- 1ppm by TCXO
Channel spacing	6.25KHz or 12.5kHz or 25kHz
Demodulation	FSK NRZ, POCSAG format 512, 1200 or 2400 Bps
Selectivity	55dB
Inter modulation rejection	60dB
Sensitivity	-110db/M (512bps), -107db/M (1200bps), -104db/M (2400bps)
Antenna	Built-in loop antenna or option SMA antenna jack
<b>Data output Interfaces</b>	
RS-232	Use J3 by 3.5mm Plug
RS-422/RS485	Use J4 by 2.0mm 2 Pin wafer
<b>Power Relay Unit</b>	
Contact Rating	2X Dry contact 3A
Insulation Resistance	DC 500V 1000MΩ.
Contact Material	Ag Alloy
Approved	UL, CUL, and TUV
